

Sarah Siteki

What motivated you to study Engineering and IT?

I have always been interested in economics. I always thought that business studies could be too one-sided and that I could get lost in it. At first, I thought that the standard in industrial engineering might be too high for me, but the versatility convinced me and made me challenge myself.

People who influenced your decision

I did a lot of aptitude tests regarding my choice of studies. This is why I would say that I influenced myself for the most part. But I was also influenced by my environment, where many engineers already exist.

Impressions of your studies

The degree programme has proven to be very versatile. I have covered engineering subjects in addition to my business subjects and have developed interests in fields that I never thought I would have.

What would you like to do after your studies?

I don't yet know what the future holds for me, which is why I'm reluctant to commit to a specific direction already. However, I hope to find a suitable intersection between business and engineering topics in which I can continue to develop. Especially with this project, I have also noticed how different methods of approaching the same issues can be, which is why I could also imagine participating in other international exchanges in order to get to know the approaches of others and to discover new ones for myself. It is never too late to learn!

Impressions of the International Summer School

I think the Summer School is great! You get so much more insight than you get from the project and the workshops on their own. The Summer School also offers a great opportunity to meet people from other cultures. It's nice to know that you are working on something together and that you might recognise the results in your everyday life, knowing that you were a part of it. It's just a great experience that you can always remember.
